GAYATRI PATIL

Cloud Operations Engineer | AWS | DevOps | Linux

patilgayatriv67@gmail.com | +91 7841967403 | Bangalore, India | linkedin.com/in/gayatri-patil-cloud-engineer

PROFESSIONAL SUMMARY

Results-driven Cloud Operations Engineer with 1 year of hands-on experience in AWS infrastructure management, Linux administration, and production support. Proven ability to design and deploy highly available, fault-tolerant architectures using EC2, S3, IAM, VPC, RDS, and ELB. Skilled in end-to-end infrastructure monitoring with Prometheus and Grafana, Docker-based deployments, and microservices architecture. Passionate about automation, reliability engineering, and continuously improving system performance.

PROFESSIONAL EXPERIENCE

Cloud Operations Engineer | Netzary Infodynamics – Bangalore, India

2025 – Present

- Monitored AWS infrastructure and application performance using Prometheus and Grafana, reducing MTTR by identifying bottlenecks proactively.
- Managed and optimized AWS services including EC2, S3, IAM, VPC, RDS, and Load Balancers for production workloads.
- Performed Linux server troubleshooting, log analysis, process monitoring, and service management across multiple environments.
- Supported application deployments using Docker and Linux, ensuring zero-downtime releases.
- Led incident handling and root cause analysis, driving resolution of production issues and preventing recurrence.
- Maintained high availability and uptime of production systems through proactive monitoring and on-call support.
- Managed backup validation, access control (IAM policies, security groups), and routine operational maintenance.
- Configured and maintained web servers (Nginx, Apache) for application hosting and performance tuning.

PROJECTS

1. Highly Available Microservices Web Application on AWS

Technologies: AWS (EC2, S3, IAM, VPC, ELB) | Linux | Docker | HAProxy | Nginx | Django | MySQL | Redis | Prometheus | Grafana

- Designed and deployed a fault-tolerant microservices web application on AWS, ensuring high availability and horizontal scalability.
- Implemented HAProxy load balancing across multiple Django application servers to improve performance and eliminate single points of failure.
- Configured Nginx to serve static content, significantly reducing backend load and improving page load times.
- Set up MySQL master-slave replication with automated failover to maintain data integrity and database availability.
- Integrated Redis caching layer to minimize database queries and enhance application response time.
- Automated code synchronization using lsyncd, eliminating deployment inconsistencies across servers.
- Built end-to-end infrastructure monitoring and alerting dashboards using Prometheus and Grafana.

2. Automated CI/CD Pipeline with GitLab and Docker on AWS EC2

Technologies: GitLab CI/CD | Docker | AWS EC2 | Nginx | Bash Scripting | Linux

- Designed and implemented a GitLab CI/CD pipeline to automate building, testing, and deployment of a Dockerized web application to AWS EC2.
- Configured .gitlab-ci.yml with stages for build, test, and deploy, reducing manual deployment effort and human errors.

- Used Docker to containerize the application, ensuring environment consistency across development and production.
- Configured Nginx as a reverse proxy on EC2 to route traffic to the running Docker container.
- Implemented SSH-based deployment from GitLab runner to EC2, enabling zero-touch production releases on every code push.

3. Automated Server Provisioning using Ansible on AWS

Technologies: Ansible | AWS EC2 | Linux (Ubuntu/CentOS) | Nginx | MySQL | Bash Scripting

- Developed Ansible playbooks to fully automate provisioning and configuration of AWS EC2 Linux servers, eliminating manual setup.
- Automated installation and configuration of Nginx, MySQL, and application dependencies across multiple servers using reusable Ansible roles.
- Managed inventory files for different environments (dev, staging, production), enabling consistent multi-environment deployments.
- Used Ansible variables and templates (Jinja2) to dynamically generate configuration files, reducing configuration drift across servers.
- Reduced server provisioning time from hours to under 10 minutes, improving team productivity and deployment reliability.

TECHNICAL SKILLS

Cloud (AWS)	EC2, S3, IAM, VPC, RDS, CloudWatch, ELB, Security Groups
DevOps & CI/CD	Docker, Git, GitLab, Ansible, Bash Scripting, Linux
Monitoring	Prometheus, Grafana, CloudWatch
Web Servers	Nginx, Apache2, HTTPD
Databases	MySQL, PostgreSQL, MongoDB
Load Balancers	HAProxy, Nginx, ELB
Caching	Redis, Memcached
OS	Linux (Ubuntu, CentOS), Windows

EDUCATION

Bachelor of Engineering (Civil) | CGPA: 8.23/10

North Maharashtra University (NMU) | 2021 – 2024

LANGUAGES

English (Professional) | Hindi (Fluent) | Marathi (Native)
